

A

DeepMutate-3D

Protein language model mutation scanning, painted onto the AlphaFold fold.

ESM-2 scores every possible point mutation as a log-likelihood ratio against the wildtype residue. Positions the model refuses to change are evolutionarily constrained, likely structural or functional cores, and glow **red**. Positions it happily swaps glow **blue**.

Example protein

Haemoglobin subunit alpha, P69905 (142 aa)

Load sequence

Protein sequence (FASTA or raw)

MVLSPADKTNVKAAWGVGHAHAGEYGAEALERMF LSFPTTKTYFPHFDLSHGSAQVKGHGKKVADALTNAVAHVDDMPNALSALSDLHAHKLRVDPWFNFKLLSHCLLVTLAAHLPAEFTPAVHASLDKFLASVSTVLTSKYR

UniProt ID

P69905

Used for the AlphaFold structure, and to fetch the sequence.

Model

ESM-2 650M (most accurate)

Larger models score better but cost more compute.

Scoring mode

Masked marginals (accurate)

Masked marginals runs one forward pass per residue.

Wildtype marginals (fast)

Sensitivity table (.csv)

Scored structure (.pdb)

Scan complete

- Residues scored: 142 | Device: cuda | Mode: Masked marginals (accurate)
- Model: facebook/esm2_t33_650M_UR50D | Inference time: 3.99 s (28.1 ms/residue)
- Mean sensitivity: -7.703 | Most fragile: D95 (-12.90), F44 (-12.47), H88 (-12.29), G60 (-11.79), G26 (-11.74)
- AlphaFold structure retrieved for P69905.
